Abstract

The *Store Link: Connecting Local Stores with Online Customers* project is an innovative digital solution aimed at bridging the gap between traditional retail stores and modern online shopping platforms. With the rapid growth of e-commerce, many small-scale local businesses struggle to compete due to the lack of digital presence and technological infrastructure. This project addresses that challenge by providing a full-stack web application that enables local kirana stores to sell their products online while allowing customers to conveniently browse, select, and order items from nearby stores.

The system is developed using modern web technologies including React for the frontend, Node.js and Express for backend services, and MongoDB for database management. It provides essential features such as user authentication, product management, cart functionality, and order placement. Additionally, advanced features like WhatsApp-based order notification, responsive user interface design, and Swiggy-style address management enhance user experience and operational efficiency.

The application workflow ensures seamless interaction between users and store owners, where customers can place orders that are stored in the database and simultaneously communicated to the store via WhatsApp. This reduces manual effort and improves communication speed. The system is designed to be scalable, user-friendly, and adaptable for real-world applications.

Overall, the project demonstrates how digital innovation can empower local businesses, improve customer convenience, and promote the adoption of technology in the retail sector. It provides a cost-effective and efficient solution that supports the growth of small businesses in the competitive e-commerce environment.
